

Task: Deploy a Static Website Using Amazon S3, CloudFront, Route 53, and GoDaddy Domain

Objective: Host a static website on Amazon S3, deliver it securely through Amazon CloudFront using an SSL certificate, map your GoDaddy domain using Route 53, and verify the website is accessible via your custom domain.

The below Steps from question 1 to question3

Step 1: Purchase a Domain from GoDaddy

Purpose

Purchase a custom domain name that visitors will use to access your website.

Steps

1. Open <https://godaddy.com>
2. Sign in or create a GoDaddy account.
3. Search for your preferred domain name.
4. Select an available domain.
5. Click **Add to Cart**.
6. Proceed to Checkout.
7. Complete the payment.
8. After purchase, verify the domain appears under **My Products**.

Example

rajkumari2010.site

Step 2: Create an S3 Bucket

Purpose

Create a storage bucket that will host the static website files.

Steps

1. Login to AWS Console.
2. Search for **S3**.
3. Click **Create bucket**.
4. Enter Bucket Name.

Example

exampledomain.com

5. Select Region.

Example

US East (N. Virginia)

6. Uncheck

Block all public access

7. Accept the warning.

8. Click Create Bucket.

Route 53 > Hosted zones > rajkumari2010.site

rajkumari2010.site was successfully created. Now you can create records in the hosted zone to specify how you want Route 53 to route traffic for your domain.

Hosted zone details

Records (2) | Accelerated recovery | DNSSEC signing | Hosted zone tags (0)

Records (2) Info

Automatic mode is the current search behavior optimized for best filter results. [To change modes go to settings.](#)

Filter records by property or value

Record name	Type	Routin...	Differ...	Alias	Value/Route traffic to
rajkumari2010.site	NS	Simple	-	No	ns-2023.awsdns-60.co.uk. ns-468.awsdns-58.com. ns-959.awsdns-55.net. ns-1149.awsdns-15.org.
rajkumari2010.site	SOA	Simple	-	No	ns-2023.awsdns-60.co.uk. a...

Step 3: Upload Website Files

Purpose

Upload the HTML, CSS, JavaScript, and image files to the bucket.

Steps

1. Open the bucket.
2. Click **Upload**.
3. Select

index.html

and other website files.

4. Click **Upload**.

Step 4: Enable Static Website Hosting

Purpose

Allow Amazon S3 to host the uploaded files as a website.

Steps

1. Open the bucket.
2. Select the **Properties** tab.
3. Scroll to

Static website hosting

4. Click **Edit**.
5. Select

Enable

6. Hosting Type

Host a static website

7. Index document

index.html

8. Error document

error.html

(Optional)

9. Save changes.
10. Copy the Website Endpoint.

Example

<http://exampledomain.com.s3-website-us-east-1.amazonaws.com>

4. Create a CDN and attach one SSL certificate.

Prerequisites

You need:

- ☒ S3 Bucket
- ☒ Static website uploaded
- ☒ Route 53 Hosted Zone (if using your own domain)
- ☒ Domain (rajkumari2010.site)

Step 1: Create S3 Bucket

1. Open AWS Console
2. Search **S3**
3. Click **Create bucket**

Example

Option	Value
Bucket Name	rajkumari2010.site

Option	Value
Region	eu-north-1 (or your preferred region)
Block Public Access	Disable (for static website)
Bucket Versioning	Disable

Click **Create Bucket**

Step 2: Request SSL Certificate

Important: CloudFront requires the certificate to be created in **US East (N. Virginia) (us-east-1)**.

1. Change AWS Region to **US East (N. Virginia)**.
2. Open **Certificate Manager (ACM)**.
3. Click **Request certificate**.
4. Choose **Request a public certificate**.
5. Add these domain names:
 - rajkumari2010.site
 - www.rajkumari2010.site
6. Choose **DNS validation**.
7. Click **Request**.

The screenshot shows the AWS Certificate Manager (ACM) console. The breadcrumb trail at the top reads: AWS Certificate Manager > Certificates > Request certificate > Request public certificate. The left sidebar shows the 'AWS Certificate Manager (ACM)' section with links for 'List certificates', 'Request certificate', 'Import certificate', and 'AWS Private CA'. Under the 'ACME' section, there are links for 'ACME certificates' (marked 'New') and 'Endpoints' (marked 'New').

The main content area is titled 'Request public certificate'. It contains three sections:

- Domain names:** A section with the instruction 'Provide one or more domain names for your certificate.' It features a text input field containing 'rajkumari2010.site' and a button labeled 'Add another name to this certificate'. A note below states: 'You can add additional names to this certificate. For example, if you're requesting a certificate for "www.example.com", you might want to add the name "example.com" so that customers can reach your site by either name.'
- Allow export:** A section with two radio button options. 'Disable export' is selected, with a note: 'Use this certificate only with integrated AWS services. The private key for this certificate will be disallowed for exporting from AWS.' The 'Enable export' option is unselected, with a note: 'Export this certificate and private key for use with any TLS workflow. ACM will charge your account based on the requested domains when the certificate is issued for the first time and for each renewal.'
- Validation method:** A section with the instruction 'Select a method for validating domain ownership.' It has two radio button options: 'DNS validation - recommended' (selected) and 'Email validation'.

Step 3: Validate Certificate

If your DNS is managed in Route 53:

1. Open the certificate.
2. Click **Create records in Route 53**.
3. Wait a few minutes until the status becomes **Issued**.

Step 4: Create CloudFront Distribution

Open CloudFront

Click **Create Distribution**

Configure:

Step 5: Configure Route 53

Open **Route 53**

Hosted Zone

rajkumari2010.site

Create an **A** record.

Choose:

- **Alias = Yes**
- **Alias Target = CloudFront Distribution**

Repeat for www if desired.

5. Create a Route 53 hosted zone and map the domain with the CDN.

Final CloudFront + SSL Configuration Steps (Brief)

1. Save CloudFront Changes

- In CloudFront → Distribution → Edit
- Verify:
 - Alternate domain name:

rajkumari2010.site

- Custom SSL certificate:

rajkumari2010.site (ACM Certificate)

- Click **Save changes**

2. Wait for CloudFront Deployment

- Go to CloudFront → Distributions
- Wait until status changes:

Deploying → Enabled

(Usually 5–15 minutes)

3. Verify ACM Certificate

- Go to ACM (Region: **us-east-1**)
- Open your certificate

Before:

In use: No

After CloudFront deployment:

In use: Yes

4. Test Website

Open:

<https://rajkumari2010.site>

Expected:

 Secure HTTPS connection

Your AWS portfolio website loads
